

Project Name: Agentic AI Interview Trainer

The Problem: Preparing for technical and behavioral job interviews is highly stressful, unguided, and expensive. Most current online preparation tools rely on static, generic question banks that fail to adapt to individual candidate resumes, specific company job descriptions, or real-time performance feedback. This leaves job seekers underprepared for dynamic, modern HR and technical recruitment processes.

The Proposed Solution: An intelligent, multi-agent AI mock interview ecosystem built natively on **IBM watsonx.ai** and developed using **IBM Bob**. The system takes a user's resume and a target job description, generating a hyper-personalized, context-aware interview loop. Using RAG (Retrieval-Augmented Generation), it anchors its questions in realistic industry benchmarks, eliminating AI hallucinations and providing candidates with actionable, real-time rubric feedback (like the STAR method) to significantly improve career readiness.
